## SUMMARY

The recent pause in the U.S. general economic recovery is having repercussions on domestic textile activity. Fiber consumption has been adversely affected by sluggish retail textile sales during recent months and resulting production cutbacks. Still, U.S. mill consumption of all fibers during calendar 1976 is expected to total around $11^{1 / 2}$ billion pounds, up a tenth from last year's depressed level. The outlook for 1977 is for moderate gains in total fiber use as higher consumer incomes and employment spur textile sales.

Cotton's share of the 1977 U.S. textile market may slip somewhat, reflecting tight supplies and market losses to manmade fibers. With the smallest cotton supply in 53 years, strong export demand, and prices currently around 50 percent above manmade fiber staples, mills are expected to increase manmade fiber use at the expense of cotion. Since 1973, cotton's share of total fiber consumption has remained close to 30 percent.

Given current price relationships between cotton and competing crops, cotton acreage next spring is likely to increase from this year. However, the exact level of production is very uncertain. More normal yields would certainly strengthen the production outlook. A preliminary 1977 upland loan rate for Middling 1 -inch cotton was recently set at 42.58 cents per pound, up 5.46 cents from the current loan.

It now appears that we will be entering the 1977/78 season next August 1 with a marginally adequate cotton carryover of around 3 million bales, down from 3.7 million on August 1, 1976, and the smallest since 1952 . The reduction stems from a disappointing 1976 crop of a half-million bales or so below anticipated $1976 / 77$ disappearance.

Based on October 1 conditions, the 1976 cotton crop was estimated at $101 / 4$ million bales, sharply above the abnormally small 1975 crop but below early season indications of $103 / 4$ million. The recent deterioration in prospects reflects adverse weather in several important cotton-producing regions. Further losses are possible in view of October's cold, wet weather in the Delta and Southwest.

The tightening supply situation is putting increased pressure on cotton prices. As of early November, the spot market price of base grade SLM $1-1 / 16$-inch cotton was nearly 80 cents per pound, up from 70 cents on August 1, and over 25 cents above a year earlier. Prices received by farmers have also strengthened, averaging $621 / 2$ cents in October.

These higher prices are placing cotton at a real disadvantage, vis-a-vis manmade fibers. Despite relatively strong demand, U.S. mill consumption of cotton this season may decline to
about 6.6 million bales ( $\pm 5$ percent) from 1975/ 76 's $7^{1 / 4}$ million. Early-season use was off considerably, and further declines are likely as mills seek to cover their needs by increasing the percentage of manmade fibers in blends. Continuing record-large cotton textile imports are also competing vigorously with U.S. mill use for domestic markets.
U.S. raw cotton export prospects remain bright. Shipments may total 4.1 to 4.7 million bales during 1976/77, up from 3.3 million last season. Increased exports reflect continuing modest recovery in foreign textile activity, coupled with extremely tight cotton supplies abroad. With the United States and the USSR as the only countries with significant export availabilities this season, we may garner about a fourth of global cotton trade, up from 18 percent in 1975/ 76.

The 1976/77 outlook for extra-long staple cotton is highlighted by reduced supplies and slightly lower disappearance. Beginning stocks of 66,000 bales may be worked down somewhat as the season progresses.

Apparel wool consumption for the first 8 months of 1976, amounted to 73.4 million pounds, up 25 percent from a year earlier. For the year, apparel wool mill use will likely range from 107 to 112 million pounds. Carpet wool consumption remains slow and will probably fall short of the nearly 16 million pounds consumed by U.S. mills in 1975.

As of September 1, 1976, commercial apparel wool stocks were estimated at about 54 million
pounds, clean basis, or about a 6 -month supply at current rates of use. Domestic mills may have to rely on imports to maintain reasonable stock levels while awaiting new clip supplies. Carpet wool stocks are adequate.

Through August, apparel wool imports totaled 28.3 million pounds, clean content, compared with 7.5 million during the same period last year. The net trade deficit of wool textiles through August was 52.7 million pounds, clean wool content, nearly doubling the negative balance of the same period in 1975.

The average farm price of wool in October was 77 cents per pound, grease basis, compared with 69 cents in September and 53 cents in October 1975. Prices are expected to remain strong with moderate increases through the rest of 1976 and into 1977. For 1976, the farm price is expected to average in the range of 65 to 70 cents per pound.

The world wool situation is highlighted by a moderate but increasing supply/demand imbalance, the result of a substantial increase in consumption and a decline in world production. Prospects for the 1976/77 season in Australia, in particular, have deteriorated due to prolonged drought. Since the beginning of 1976, world prices have advanced and stockpiles have been significantly drawn down.

The Texas mohair market remains quiet, with bids on average adult hair reported around $\$ 3.05$ per pound, grease basis. Exports through August totaled 4.3 million pounds, compared with 5.6 million for the same period last year.

## COTTON AND WOOL SITUATION

## TEXTILES AND THE ECONOMY

Prospects continue favorable for further general economic expansion into 1977. Real economic growth slowed in the second and third quarters of 1976, but the sluggishness is considered a pause that will be followed by a resumption of the economic recovery. Although consumer spending continues to gain, increasing expenditures on durable "big ticket" items have hurt sales of nondurables such as clothing and household textile products. Relatively high unemployment and underutilization of capacity continue to plague the general economic recovery.

With rather static retail sales of textiles since May resulting in some fabric inventory accumulation, U.S. textile mill activity has slowed in recent months. Mills are extremely inventory conscious now and often react quickly to avert unwanted buildups in textile stocks. As a result, some mills closed during the week of Labor Day while others have reduced their work week. Cotton, wool, and manmade fiber use have all been adversely affected by these production slowdowns
and, consequently, mill consumption in the last half of 1976 will not match the first half's 5.9 billion pounds.

For calendar 1976 as a whole, mill consumption of all fibers may total around $111 / 2$ billion pounds, up from 10.6 billion last year but moderately below 1973 's record high of $121 / 2$ billion. Both cotton's and wool's shares of the textile market are expected to remain rather stable at close to 29 percent and 1 percent, respectively. On a per capita basis, total fiber consumption may amount to 53 to 54 pounds, up from $491 / 2$ pounds in 1975. Both cotton and manmade fiber use are increasing about a tenth (figure 1).

Fiber consumption is expected to increase further in 1977 based on prospects for higher disposable per capita income and reduced unemployment. Large Christmas sales of apparel and other textile products during the next 6 weeks should help unclog textile pipelines and give mill activity a needed shot in the arm.

## OUTLOOK FOR 1977/78

## Cotton Program Provisions

Upland cotton producers in 1977/78 again will be operating under the Agriculture and Consumer Protection Act of 1973. Major provisions of the program for the 1977 upland cotton crop include:

- A preliminary loan rate of 42.58 cents per pound for Middling 1 -inch cotton (micronaire 3.5 through 4.9) net weight, at average U.S. location, up 5.46 cents from the current loan rate.
- A national production goal of 13 million (480pound) bales, compared with 12.4 million this year.
- A national base acreage allotment of 11 mil lion acres, the same as in 1976.
- No cropland set-aside or conserving base requirements as conditions of program eligibility.
- A $\$ 20,000$ payment limitation per producer of cotton, wheat, and feed grains.

The target price for 1977 crop upland cotton will be announced in late January or early February. Current calculations indicate a target price of around 49 to 50 cents per pound, compared with 43.2 cents for the 1976 crop.

## Production Prospects

There is growing speculation about 1977 cotton crop prospects. Although current price relationships among cotton, soybeans, grain sorghum, and other competing crops point to cotton acreage considerably above the $11^{3 / 4}$ million acres planted in 1976, there is uncertainty over the exact level. It is certain, however, that if current prices for these crops prevail at planting time next spring, there will be sharply more cotton acreage planted in the Southwest and Far West. Moving eastward, more attractive soybean prices will limit expansion in cotton acreage in the Delta and Southeast, as will relatively high production costs and risks throughout the Cotton Belt. Still,

Figure 1
given moderately higher acreage and more normal yields, cotton production could total sharply above 1976/77 output.

## Disappearance Prospects

The outlook for 1977/78 cotton disappearance is less optimistic. U.S. mill use will continue to depend heavily on overall textile activity and the health of the general economy. The level of textile imports will greatly influence the extent to which our cotton textiles will be supplied by U.S. mills. Further expansion in general economic activity should boost total fiber use above this season's level. However, cotton's share of this market may slip if current price relationships between cotton and manmade fibers continue. Today, cotton is priced about 50 percent above competitive manmade fiber staples.

Another relatively strong export market for U.S. cotton may be in store for next season. With firm demand for cotton continuing abroad and current prospects for less than a 4 months' supply on hand next August 1 in foreign countries, U.S. export prospects appear favorable, particularly early in the season. For 1977/78 as a whole,
U.S. shipments may about match this season's anticipated level.

## OUTLOOK FOR 1976/77

## Overview

Relatively strong demand in the face of tightening supplies highlights the 1976/77 cotton outlook. U.S. mill use and exports are holding up remarkably well in view of current prices. Combined mill consumption and exports are expected to at least equal last season's level and could total more. Meanwhile, despite the sharply larger 1976 crop, this season's supply is down slightly. Thus, stocks are being worked down and may drop a half million bales or so during 1976/77 to around the 3 -million-bale level, the smallest since 1952.

The current season began on August 1 with cotton stocks of 3.7 million bales, down 2 million from a year earlier. Based on October 1 indications, the 1976 crop was estimated at slightly over 10 million bales, sharply above the abnormally small 1975 crop but below early-season indications of $10^{3 / 4}$ million. So the $1976 / 77$ supply is slightly below last season's 14.1 million bales.

On the demand side, sharply larger cotton exports are expected to more than offset mod-
erately smaller U.S. mill use, meaning that disappearance will likely exceed last season's level. As a result, the carryover next August 1 may total only about a 4 months' supply for anticipated mill use and exports in early 1977/78 (table 16 and figure 2). Although these 3 million bales or so may prove adequate from an aggregate standpoint, the carryover of certain staples and grades may be insufficient to satisfy prospective mill use and export requirements (tables 17 and 18). The shorter staple lengths will likely be in tightest supply.

## Sharply Smaller Carryover Drops Supply to Lowest Level Since 1923/24

This season's cotton supply, at 14 million bales, is slightly below the 1975/76 level and the smallest in 53 years. The 2-million-bale reduction in carryover from a year earlier, along with some recent deterioration in 1976 crop prospects, is responsible for the reduced supply.

With increased production in Texas and Oklahoma where output of cotton stapling less than 1 inch is concentrated, the staple length distribution of the U.S. cotton supply is more
heavily weighted toward the shorter staples. Cotton less than 1 inch may comprise about a fifth of the total or around $2^{1 / 2}$ million bales, compared with 17 percent last year. Supplies of medium staples also may be slightly larger. However, supplies of cotton stapling $1-1 / 16$ inches and longer are dropping about onehalf million bales to around 9 million. Still, these longer staples may account for about two-thirds of the total, compared with 70 percent last year (table 19).

With $1975 / 76$ disappearance sharply in excess of the 1975 cotton crop, the U.S. carryover of all kinds of cotton on August 1 dropped to a relatively low 3.7 million bales. While upland stocks totaled $3,615,000$ ( 480 -pound) bales, extra-long staple stocks were placed at around 66,000 (table 16).

Privately-owned cotton stocks on August 1 were reported at $31 / 2$ million running bales, down from 4.6 million on August 1, 1975. While stocks at consuming establishments increased slightly to 1.2 million bales, stocks in public storage dropped a third to 2.1 million (table 1).

About 70 percent of beginning stocks of upland cotton stapled 1-1/16 inches and over, compared with 74 percent a year earlier (table 19). The average staple length of 33.8 thirty-seconds

Figure 2

| 1976 | 1,210 | 2,123 | 150 | 3,483 | 111 | 3,594 |

[^1]inches and grade index of 91.3 were about the same as for the previous carryover.
With cotton prices considerably above loan rates over the past year, stocks under loan to the Commodity Credit Corporation (CCC) are virtually depleted. As of October 13, CCC inventories totaled only 30,000 bales, compared with about 250,000 a year earlier (table 2).

## Crop Prospects Falter

The October 1 estimate of $10 \frac{1}{4}$ million bales for the 1976 cotton crop is about 5 percent below early-season indications but still over 20 percent above the small 1975 crop. The recent downward revision in the production estimate reflects the impact of earlier adverse weather in several important cotton-producing regions. Cotton planting generally got off to a late start in both the

Delta and High Plains, reflecting cold wet weather in the Delta and extremely dry conditions on the High Plains. Continuing adverse weather this fall has damaged yield prospects. The western areas of Texas and Oklahoma were subjected to frosty temperatures in early October, raising the distinct possibility of further cotton losses.

Cotton harvesting activity is lagging recent years. Ginnings through mid-October amounted to about $1 \frac{1}{2}$ million bales, about 15 percent of expected production. Normally, about a fourth of the crop is ginned by this date. This season's early ginnings contained large proportions of high-grade, long staple cotton (table 3). However, the quality of the 1976 crop will likely suffer as the season progresses.

The national average yield per harvested acre is estimated at 445 pounds based on October 1 conditions, down from 453 pounds last year and

5 to 10 percent below normal. But with a fourth larger acreage for harvest, domestic production is up sharply, especially in the western half of the Cotton Belt which is accounting for three-fourths of this year's increase in U.S. output. For instance, expected output is up 33 percent in the Far West and 23 percent in the Southwest. Production gains in the Southeast and Delta are placed at around 30 percent and 12 percent, respectively (tables 20 and 21 and figure 3 ).

## Cotton Prices at High Level

The ups and downs in cotton prices continue to make headlines. After falling from the July peak, spot market prices have again climbed since August, primarily reflecting recent deterioration in production prospects and tightening supplies.

As of early November, the spot market price of base grade SLM 1-1/16-inch cotton was nearly 80 cents per pound, up from 70 cents on August 1 and over 25 cents above a year earlier. Prices received by farmers also have strengthened in recent months, increasing from 60.4 cents per pound in August to $62 \frac{1}{2}$ cents in October (table22 and figure 4).

As cotton prices trended up last spring and summer, forward crop contracting picked up sharply. Farmers have booked about one-half their 1976 production, compared with only 10 percent last year. By regions, forward contracting of the current crop ranges from nearly a fourth in the Southwest to nearly threefourths in the Delta. Contracting in the Southeast and Far West stands at 52 percent and 69 percent, respectively.

Cotton futures prices have paralleled recent spot market price movements. As of early November, December 1976 futures were over 80 cents per pound, about 10 cents above the early August level. In comparison, December 1977 futures were around 68 cents per pound.

## Mill Use Down

After recovering sharply from the 1974/75 recession, use of all fibers by U.S. textile mills has eased off since January. In the case of cotton, the seasonally adjusted daily rate of consumption has trended down about $11 / 2$ percent per month during 1976, reflecting some softness in overall retail textile demand and the desire of mills to keep inventories under close control (figure 5). As mill consumption during this period reflected cotton prices only slightly above manmade fiber prices, there has not been any significant substitution of manmade fibers for cotton. However, market losses are likely later in the season as mills are confronted with the 1976 cotton crop, which is priced nearly onethird higher than the 1975 crop. In comparison, manmade fiber prices are close to year-earlier levels (tables 4 and 5 ).

Mill-delivered cotton prices now are around 50 percent above manmade fiber staple. For instance, during August and September, mills paid an average of nearly 80 cents per pound for Middling 1-1/16-inch cotton, compared with 52 to 53 cents for rayon and polyester staple (table 23). However, rayon list prices were increased 4 cents per pound in October, and trade sources indicate that polyester staple prices may soon follow suit in order to bolster sagging profit margins and encourage the additional capacity needed to satisfy projected future growth in textile demand.

After consuming cotton at an annual rate of 6.9 million bales in August, U.S. mills cut use 3 percent in September-to an annual rate of 6.7 million. With the current price disparity between cotton and manmade fibers along with recent increases in the ratio of stocks to unfilled orders for cotton broadwoven goods (table 6), further slippage in cotton use is indicated for coming months. For the 1976/77 season as a whole, mill consumption may total about 6.6 million bales ( +5 percent), down from $7^{1 / 4}$ million last season.

There has been relatively strong demand for cotton products at the retail level over the past year. All-cotton denim and corduroy goods have played a big role in cotton's success. However, the importance of blends cannot be overlooked. Cotton consumed in blends, primarily with polyester, accounts for nearly a fifth of total cotton use (table 24).

Compiled from reports of the Bureau of the Census.

Figure 7
combined U.S. mill use and exports may total slightly below last season's 101,000 bales. Thus, stocks will be worked down during the season.

Based on October 1 indications, the 1976 ELS cotton crop is placed at 57,500 bales, compared with last season's 55,000 . This season's average yield is estimated at 536 pounds per harvested acre, the highest since 1968/69.

On the demand side, 1976/77 mill use may fall moderately below the 90,000 bales consumed last season as higher prices discourage use (table 8). Exports also are estimated to total less than 1975/76's 11,000 bales.

For the 1977 crop of ELS cotton, USDA recently announced a national marketing quota of 113,000 bales ( 480 -pound), up from 82,481 this year, and a national acreage allotment of 120,000 acres, compared with 83,702 acres for the 1976 crop. This allotment represents the acreage neces-sary-based on the national average yield per planted acre of 452 pounds for 1972-75-to pro-
duce an amount of ELS cotton equal to the national marketing quota.

The ELS quota and allotment were increased in order to assure adequate production and to discourage large imports of ELS cotton. Imports during 1975/76 exceeded production for the first time since 1967/68 (table 16).

The 1977 marketing quota is subject to approval by ELS cotton growers in a December 610 mail referendum. At least two-thirds of those voting must approve quotas if they are to continue in effect. If quotas are approved, producers will be eligible for loans on ELS cotton in 1977 if they have complied with their acreage allotment. The preliminary ELS cotton national average loan rate for the 1977 crop has been set at 76.7 cents per pound ( 65 percent of the October parity price), up from 73.24 cents this season. However, there will be no direct payment if this loan rate is finalized. This season, producers are receiving a direct payment of 1.51 cents per pound.

## WOOL SITUATION

## U.S. SITUATION

## Apparel Wool Consumption Off Slightly

Apparel wool mill consumption in August totaled 7.6 million pounds, clean basis, compared with 7.3 million in July and 8.1 million in August 1975. However, on a seasonally adjusted basis, August consumption showed a drop of about 11 percent from July's total (tables 9, 32, and figure 8). Through August, mill consumption totaled 73.4 million pounds, up 25 percent from the 58.6 million consumed during the same period last year. For the year, mill consumption is likely
to total near the lower end of the 107 to 112 million pound range we projected last winter. We expect mill use to pick up slightly in the fourth quarter from the seasonally low rates of use in July and August. However, the ratio of stocks to unfilled orders of finished wool apparel fabrics stood at 38 percent in August, up from levels of around 27 to 30 percent in late 1975 and early 1976 (table 10). A rise in the ratio often signals a decline in future mill use, other things equal. Also, wool prices continue to increase relative to manmade fiber prices. The result may be some further substitution of manmade fibers for wool in 1977.

Table 9-U.S. mill consumption of raw wool, scoured basis

| December | 35 | 93 | 29 |  |

Compiled from reports of the Bureau of the Census.

Domestic consumption (mill use plus the raw wool content of the net import balance in wool textiles) of apparel wool through August amounted to nearly 118.5 million pounds, clean basis, compared to 78.5 million during the same period in 1975, an increase of 51 percent. Nearly 45 percent of the 1976 domestic consumption figure is represented by the net import balance in wool textiles. However, in July-August, the net import balance in wool textiles accounted for 56 percent of domestic apparel wool consumption.

## Carpet Wool Consumption Still Slow

In sharp contrast to the pickup in apparel wool demand this year, carpet wool mill use is falling short of last year's depressed level. In August, carpet wool consumption totaled 1.4 million pounds, clean basis, up sharply from July,
but still 15 percent below the August 1975 level. Through August, total carpet wool consumption equaled 9.4 million pounds, clean basis, 12 percent below the 10.6 million recorded during the same period last year (table 9 and figure 8).

Carpet wool use continues to decline even though shipments of carpets and rugs have risen steadily since the first quarter of 1975 (table 11). Carpet wool use in 1976 will total near 15 million pounds, clean basis, down from 15.9 million in 1975. The true picture of the decline in carpet wool use is best illustrated by the fact that as recently as 1973, more than 75 million pounds of carpet wool were consumed in U.S. mills.

## Interfiber Competition

Total fibers consumed in domestic woolen and worsted mills in the January-August period of 1976, at 341 million pounds, scoured basis, were 6 percent above the same period in 1975. Shorn and pulled wool accounted for 24.3 percent of the total, compared with 21.6 percent a year earlier. Wool's share of worsted consumption increased from 39.7 to 46.4 percent as manmade fiber use showed a corresponding percentage decline. Wool's share of carpet and rug yarn production declined by about one percent (table 33 and figure 9).

## APPAREL AND CARPET WOOL MILL CONSUMPTION

Figure 8

## Review of Domestic Supply Situation

Shorn wool production in the United States during 1976 is estimated at 108 million pounds, grease basis, 10 percent less than in 1975 and 18 percent below 1974. The number of sheep and lambs shorn is estimated at 13.4 million, down 7 percent from 1975. The average fleece weight for 1976 is estimated at 8.08 pounds compared with 8.31 pounds in 1975 . On a clean basis, total shorn and pulled wool production in 1976 will be about 61.1 million pounds.

Total commercial stocks of raw wool as of January 1, 1976, were 47.5 million pounds, scoured basis. Apparel wool stocks totaled 39.5 million pounds, of which 31.5 million were domestic and 8 million were foreign. As of September 1, 1976, commercial stocks of apparel wool were estimated at about 54.4 million pounds, or about a 6 -month supply (through February 1977). Since new domestic supplies will not be available in quantity until March or April of 1977, we may see imports of apparel wool pick up considerably in late 1976 and early 1977. The vast majority of the imported apparel wool is dutiable at 25.5 cents per clean pound.

Carpet wool stocks as of September 1 were estimated at about 12 million pounds, scoured basis,
which is nearly a 9 -month supply at current rates of mill use. Carpet class wools are not produced in this country, and the imported wool is not dutiable. Little change is seen in the carpet wool situation with respect to mill consumption and import needs.

## Raw Wool Prices Show Strength

The average farm price of wool in October was 76.7 cents per pound, grease basis, compared with 68.8 cents in September and 52.8 cents in October 1975 (table 12). The fall in domestic wool prices beginning in 1973 was checked in mid-1975, and prices have moved steadily upward since then in response to the resurgence in wool demand, smaller domestic supplies, and an increasing reliance on imports.

Prices are expected to continue strong over the next few months. Based on the historical monthly distribution of raw wool sales, the average farm price through October is estimated in the $65-68$ cents per pound range. With the support price at 72 cents per pound, the 1976 incentive payment to growers will be small.

The floor price increase in Australia is not expected to have an immediate impact on U.S.

prices since Australian auction prices are currently above the floor levels. However, the action by the Australian Wool Corporation should shore up world and U.S. prices over the next two years. Of more immediate importance to U.S. wool prices may be the decrease in Australian wool production in the 1976/77 Australian season, and the likelihood of a sharp drop in sheep numbers in that country due to the prolonged drought.

## Medium Wool Prices on Rise

The price of wool delivered to domestic mills continued to rise in September. Since the first of the year, territory fine wools have risen by 10 to 15 cents per clean pound (averaging about 7 percent). However, territory medium wools have increased by 18 to 40 cents per pound (averaging about 28 percent). Similar patterns are exhibited by graded fleece shorn wool prices (table 34).

The strong worldwide demand for medium wools of the type used in sweater yarns is causing prices of these wools to move higher. Medium wool stocks are also tighter than the fine wools used in woven worsted fabrics. And the Australian stockpile is definitely tilted toward the finer wools. As a result of the rapid rise in domestic medium wool prices, the spread between Australian and U.S. medium wool prices narrowed throughout 1976 until September, when Australian prices increased sharply. The spread in September was U.S. 48 cents per pound, or about 22 cents excluding the duty. The spread between fine wool prices has remained practically unchanged over the past 6 months, and in September, was about 11 cents per pound excluding the duty (table 34 and figure 10).

## Apparel Wool Imports Up Sharply

The increased demand for apparel wool in the United States and the continued decline in the size of the domestic clip has resulted in a marked increase in imports this year. Through August, apparel wool imports for consumption totaled 28.3 million pounds, clean basis, compared with 7.5 million in the same period last year and only 16.6 million for all of 1975 (table 13). Dutiable imports in August were nearly 4 million pounds, up from 2.7 million in July. Imports are likely to pick up in late 1976 and early 1977 as mills attempt to retain adequate stocks of apparel wool while awaiting the 1977 domestic clip. As in the past, the bulk of the apparel wool imports are grades 60 's and finer (table 14). About 73 prcent of the dutiable imports are from Australia.

Imports of duty-free (carpet) wool for consumption through August totaled 13.4 million pounds, clean basis, compared with 9.8 million during the same period last year and 17 million for all of 1975. Wool grades 40 's and coarser accounted for about 76 percent of the duty-free imports (table 14). About 69 percent of the imports so far this year are from New Zealand.

${ }^{1}$ Preliminary.
Compiled from reports of the Bureau of the Census.

The factors that have encouraged raw wool imports have limited U.S. exports. Through August, only 1 million pounds, clean basis, of raw wool were exported, compared with 6.7 million during the same perod last year. The bulk of the exports have been to Western Europe, particularly to Belgium (table 35).

## Textile Production and Trade

U.S. production of wool top in July totaled 3.7 million pounds, compared with the June total of 5.6 million and the July 1975 total of 4.4 million. Total production during the first 7 months of 1976 amounted to 32.2 million pounds, up from 25.6 million during the same period in 1975.

Exports of wool top through August amounted to 4.4 million pounds, compared with 7.7 million during the same period last year. About 2.4 million pounds ( 54 percent) have been exported to Japan so far this year (table 35).

Although domestic production of woolen and worsted fabrics in the first half of 1976 was up significantly over the first half of 1975, imported finished and semi-finished wool products are being increasingly relied upon to meet domestic needs. In August, the raw wool content of U.S. imports of wool textiles for consumption totaled 12.2 million pounds, compared with 10.6 million in July and 7.3 million in August 1975. Through August of this year, the raw wool content of U.S. wool textile imports amounted to 64 million pounds, as opposed to only 40.2 million pounds during the same period in 1975 and 68.1 million for all of 1975. Of the 64 million pounds imported so far this year, about 55 million consisted of apparel manufactures.

The raw wool content of U.S. exports of wool textiles amounted to 11.3 million pounds through August of this year, down from the 14.6 million exported during the same period in 1975. As a
result, the net import balance through August was 52.7 million pounds, raw wool content, compared to 26.6 million through August 1975. For 1976, the net import balance may total $75-80$ million pounds, well above 1975's 47 million. Last year, the net import balance in wool textiles equaled 43 percent of total domestic mill use, but through August of this year the percentage has risen to 64 percent. (Details of textile trade are in tables 36 and 37.)

## WORLD SITUATION

## Overview

The world wool situation in 1976 is highlighted by a growing supply/demand imbalance resulting from a marked increase in consumption and a decline in world wool production. Wool production prospects deteriorated as the year progressed due to adverse weather conditions, especially the widespread drought in Australia. As the pressure on supplies intensified, prices advanced and the wool stockpiles amassed in Australia, New Zealand, and South Africa were drawn down substantially. In sum, the world wool textile industry has recovered significantly from the low point of the recession. Further recovery is contingent upon continued general economic growth and the avoidance of further sharp increases in wool prices relative to competing fiber prices.

## Wool Textile Activity Recovering

Data for the first quarter of 1976 reveal a substantial increase in wool mill consumption by the 8 leading non-Communist wool textile manufacturing countries for which data are available (table 15). The extent of the recovery is indicated by an increase in wool consumption of nearly 29 percent over the first quarter of 1975, and an increase of 35 percent above the second quarter of 1975 -the bottom of the textile cycle. The rate of recovery has slackened somewhat as comparisons between the fourth quarter of 1975 and the first quarter of 1976 indicate. During this time, wool consumption increased by just 5 percent, and even less on a seasonally adjusted basis. Later data for the United Kingdom show a 2-percent drop in wool consumption between the first and second quarters of 1976, and the rate of mill use in the United States has definitely leveled out in the second and third quarters.

## Stockpiles Drawn Down; Production Prospects Deteriorate

The decline in new wool production along with the upsurge in demand has led to a substantial

Table 15-Mill consumption of wool, selected countries, clean content

${ }^{1}$ Preliminary. ${ }^{2}$ Consumption on woolen and worsted system only.
Compled from reports of the Commonwealth Secretariat, and the Bureau of the census.
rundown in the stocks accumulated by the wool marketing authorities in Australia, New Zealand, and South Africa.

The latest available figure for stocks held by the Australian Wool Corporation (AWC) is for June 25, 1976. At that time, the AWC held 1.3 million bales (about 249 million pounds, clean), down nearly 0.6 million ( 107 million pounds) from the November 1975 peak. Although the floor prices were raised by an average of 14 percent for the 1976/77 auction season which began in August, AWC purchases have been nil since market prices have been above the floor levels. For example, the auction price for the 21 micron wool ( 64 's) in mid-October was $\mathrm{A} \$ 3.15$ per kilogram (U.S. $\$ 1.77$ per pound), compared with the new floor level of A $\$ 2.75$ per kilogram (U.S. $\$ 1.55$ per pound). Later data should show a further rundown in AWC stocks.

The Australian Wool Production Forecasting Committee on September 22 revised estimated 1976/77 (July-June) shorn wool production downward to approximately 1.39 billion pounds, grease basis. This was down 41 million pounds from the July estimate and about 8 percent lower than last season's total. The widespread drought has lowered lambing percentages, increased mortality rates, and led to increased livestock slaughter. Trade sources are estimating that Australian sheep numbers may total only 138 million head nextMarch,
compared with 149 million in March 1976.
Stocks held by the New Zealand Wool Marketing Corporation were down to 6.5 million pounds, clean, at the end of August after an opening stock of 12.3 million on July 1, 1976. July 1, 1975 stocks totaled 52.6 million pounds. In South Africa, season-ending stocks (June 30) were estimated at 17 million pounds, clean, down from June 30, 1975 stocks of 30 million. Shorn wool production in these two countries is expected to increase only slightly in 1976/77.

## Mohair Situation

The Texas mohair market is quiet with only occasional sales reported. About 350,000 pounds of fall adult hair sold in late October at $\$ 3$ to $\$ 3.10$ per pound, grease basis, f.o.b. warehouse. After a period of falling prices, the October 19 auction in South Africa saw adult hair prices up 5 percent over the October 5 auction and kid hair up 10 to 12 percent. U.S. exports through August totaled 4.3 million pounds, compared to 5.6 million during the same period last year. The United Kingdom has imported 2.9 million pounds of U.S. mohair so far this year (table 35). The weakening British pound is raising the price of our mohair to the United Kingdom and could result in a cut in our exports.

[^0]:    ${ }^{1}$ Preliminary. ${ }^{2}$ Seasonally adjusted. ${ }^{3} 5$-week period. ${ }^{4}$ End of month. ${ }^{5}$ Effective following month. ${ }^{6}$ Equivalent raw cotton. ${ }^{7}$ On woolen and worsted system. ${ }^{8}$ Domestic and duty-paid

[^1]:    ${ }^{1}$ Data excludes cotton sold by CCC for delivery on August 1. Includes cotton pooled, owned, loans outstanding, and cotton released from the stockpile. ${ }^{2}$ Running bales.

    Bureau of the Census and Agricultural Stabilization and Conservation Service.

[^2]:    ${ }^{1}$ compiled from Bureau of the Census data and adjusted to an August 1,480 -pound net weight basis. Excludes preseason ginnings. ${ }^{2}$ Includes preseason ginnings. ${ }^{3}$ Tótals made from ${ }_{5}$ unrounded data. ${ }^{4}$ Adjusted to August 1-July 31 marketing year. ${ }^{5}$ Difference between ending stocks based on Census data and preceding season's supply less distribution. For upland cotton, this difference primarily reflects an increase of an estimated 1 percent in average bale weights due to moisture absorbtion once cotton is ginned and begins to flow through marketing channels. Additional moisture is absorbed by cotton moving in export channels. For ELS cotton, this difference reflects, in part, reporting discrepencies for stocks, mill consumption, and exports. In addition, ELS supply-demand balances are altered by
    significant quantities of foreign cotton released from the National Stockpile and included in beginning stocks during 1963-67. ${ }^{6}$ Factors used to convert running bales to equivalent 480 -pound net weight bales for carryover and consumption of domestic cotton are based on the relationship between 480 pounds and the gin weight of a running bale, raised by 1 percent (moisture factor). ${ }^{7}$ Includes small amount destroyed. ${ }^{8}$ Preliminary. ${ }^{9}$ Preliminary and estimated. ${ }^{10} \mathrm{Crop}$ Reporting Board report of October 12, 1976. ${ }^{11}$ Includes American Pima, Sea Island, and foreign grown ELS cotton. ${ }^{12}$ Imports exceed quota of 85,600 bales, in part, because import data are not adjusted to August 1-July 31 marketing year. Also, may include 6,000 or more bales of cotton stapling less than $1-3 / 8$ inches.

[^3]:    ${ }^{1}$ Estimated. ${ }^{2} 480$-pound net weight. ${ }^{3}$ Difference between sum of estimated raw cotton consumption in itemized products and reported total mill consumption. Reflects cotton consumption in minor uses, such as tire cord, as well as inventory changes and lags between raw cotton consumption and production of textile products.

    Based on data reported in Current Industrial Reports, Bureau of the Census, and Cotton Counts its Customers, National Cotton Council of America.

[^4]:    ${ }^{1}$ Includes fabrics, tire cord and cloth for export to the Philippines to be embroidered and otherwise manufactured and returned to the United States. ${ }^{2}$ Includes tapestry and upholstery fabrics, table damask, pile fabrics and remnants. ${ }^{3}$ Includes curtains and draperies, house furnishings not elsewhere specified. ${ }_{4}$ Includes gloves and mitts of woven fabric. ${ }^{5}$ Includes underwear and outerwear of woven fabric, handkerchiefs, and wearing apparel containing mixed fibers (corsets, brassieres, and girdles,

[^5]:    ${ }^{1}$ Includes small amount of "other" mixtures.

[^6]:    ${ }^{1}$ Excludes preseason ginnings. ${ }^{2}$ Totals may not add due to rounding. ${ }^{3}$ Includes cotton destroyed and unaccounted for. ${ }^{4}$ Bales of 480 -pound net. ${ }^{5}$ Less than 50,000 bales. ${ }^{6}$ Preliminary. ${ }^{7}$ Estimated.
    *Foreign data as of October 15, 1976.
    Bureau of the Census, Statistical Reporting Service, and Foreign Agricultural Service.

[^7]:    ${ }^{1}$ Prellminary. ${ }^{2}$ Includes nolls, reprocessed and reused wool, mohair, alpaca, vicuna, and other specialty hair fibers as well as cotton, jute, and other vegetable fibers.

[^8]:    Compled from reports of the Bureau of the Census.

[^9]:    ${ }^{1}$ Beginning January 1976 the unit designation terminology for wool prices changed to microns; for example, Fine good french combing and staple now reads as: 64 's ( $20.60-22.04 \mathrm{MICRONS}$ ) Staple 2-3/4' and up, and French combing 2-1/4"-2-3/4'. ${ }^{2}$ Beginning June 1976 average prices received by farmers for
